JOB INSTRUCTION

Production Schedule: Load it, Pick the Lines, Print it

Follow the steps in order. Do one step at a time. Each step shows exactly what to click.

For	Anyone printing the Production Schedule (1st, 2nd or 3rd shift)	**Prepared by**	
Time	About 5 minutes	**Approved by**	

You will do 3 jobs, in this order

A
Load the schedule
Bring in the Excel file

B
Pick the lines
Set each line's status

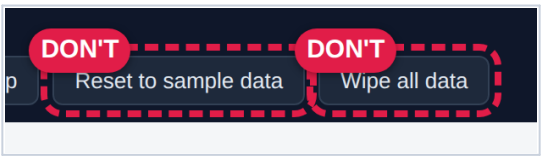

C
Print it
Print and post the report

What you need

• A computer with LineUp open in the web browser.
• Your shift's **password**. The app asks for it every time it is opened.
• Today's Excel schedule file saved on that computer (it ends in **.xlsx**, **.xlsm** or **.xls**). It is usually in the **Downloads** folder.
• A printer.

3 golden rules

1. **Check the shift first.** The top right corner must show YOUR shift. If it shows another shift, click Lock and unlock with your shift's password.
2. **Check the import screen before you click the blue button.** It replaces the whole schedule for your shift.
3. **Never click these two buttons.** They erase the schedule for the whole shift. If you click one by mistake, click **Cancel**. Never type WIPE.

Never click “Reset to sample data” or “Wipe all data”.

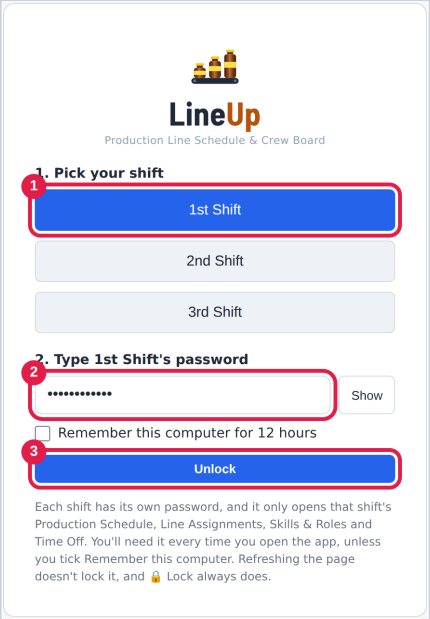

TIP: Made a mistake? Click **Undo** (top left of the app) **right away** — before you refresh or close the page. It puts things back the way they were.

A Load the schedule from Excel

Do this once at the start of the shift, or when a new schedule comes out.

1 Unlock the app

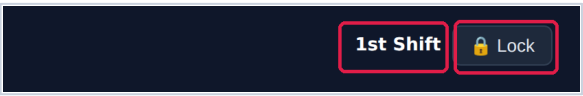

A short intro plays first (click anywhere to skip it). The app asks for this every time it is opened. Click your shift (1), type your shift's password (2), then click **Unlock** (3). Click **Show** to see what you typed. To skip the password on this computer for 12 hours, tick **Remember this computer** before you click Unlock.

✓ **You should see:** the app opens. It stays unlocked until the app is closed (or for 12 hours if you ticked Remember this computer), or until someone clicks Lock. Refreshing the page does not lock it.

2 Check the shift in the top right corner

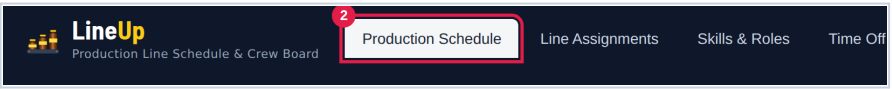

It must say **your** shift (1st Shift, 2nd Shift or 3rd Shift). If it shows another shift, click **Lock**, then unlock with your shift's password (step 1).

✓ **You should see:** your shift's name next to the Lock button.

3 Click the “Production Schedule” tab

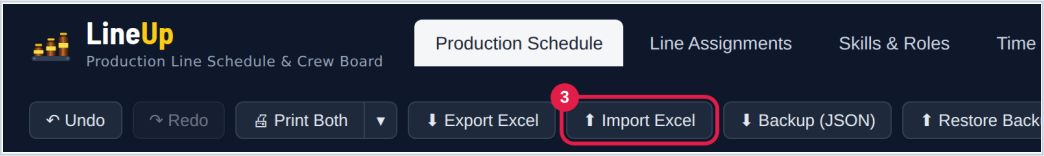

It is at the top of the page, next to the app name.

✓ **You should see:** the Production Schedule tab turns white (selected).

4 Click “Import Excel”

It is in the dark toolbar under the tabs.

✓ **You should see:** a window opens to pick a file.

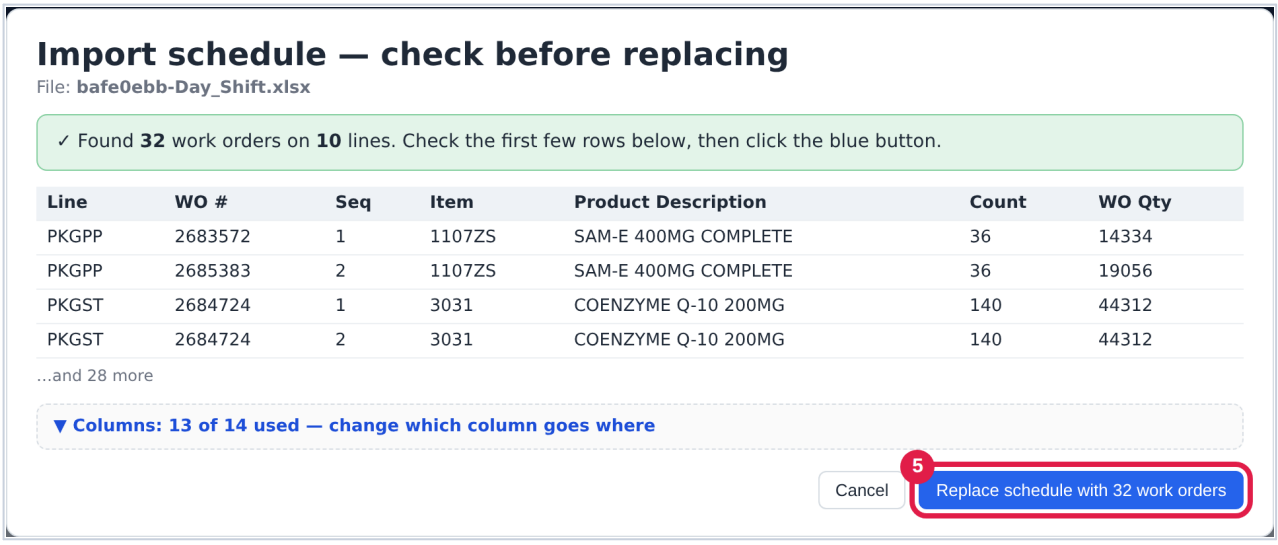

5 Pick the Excel file and click “Open”

In the window: click **Downloads** on the left (or wherever the file was saved). Click the schedule file **once**, then click **Open**.

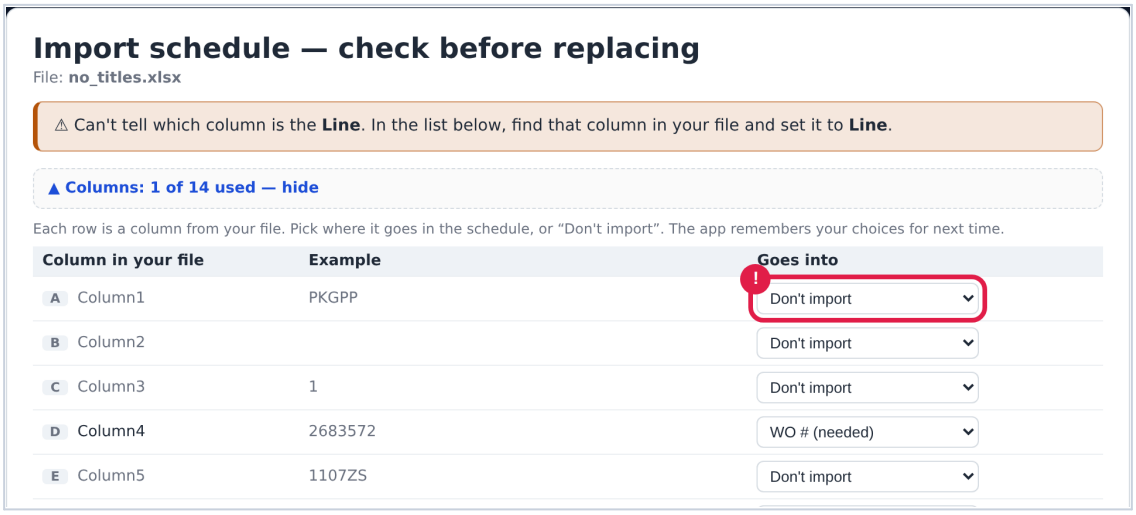

✓ **You should see:** the **Import schedule — check before replacing** screen (next step).

6 Check the import screen, then click the blue button

The green box says how many work orders it found, with the first few rows underneath. If they look right, click the blue **Replace schedule with … work orders** button. If the number looks wrong (for example far too few), click **Cancel** and check you picked the right file.

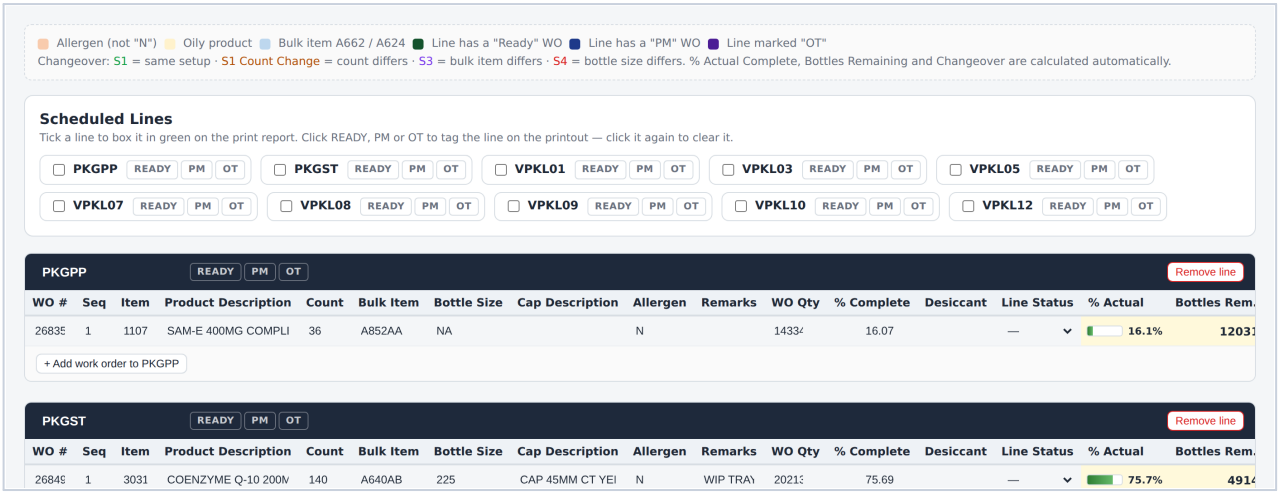

CAREFUL: If the box is orange and says “Can't tell which column is the Line” (or WO #): the list of your file's columns opens by itself. Find the column that holds the line names (like VPKL01) or the work order numbers — the **Example** column shows what's in it — and in its **Goes into** box pick **Line** or **WO #**. The blue button turns on. The app remembers this, so next time it's automatic.

Here the Line column was not found — set Column1 (it holds PKGPP) to **Line**.

7 Check the schedule loaded

Scroll down a little. Each production line has its own dark bar with its work orders underneath. Pick 2 or 3 work order numbers and make sure they match the Excel file.

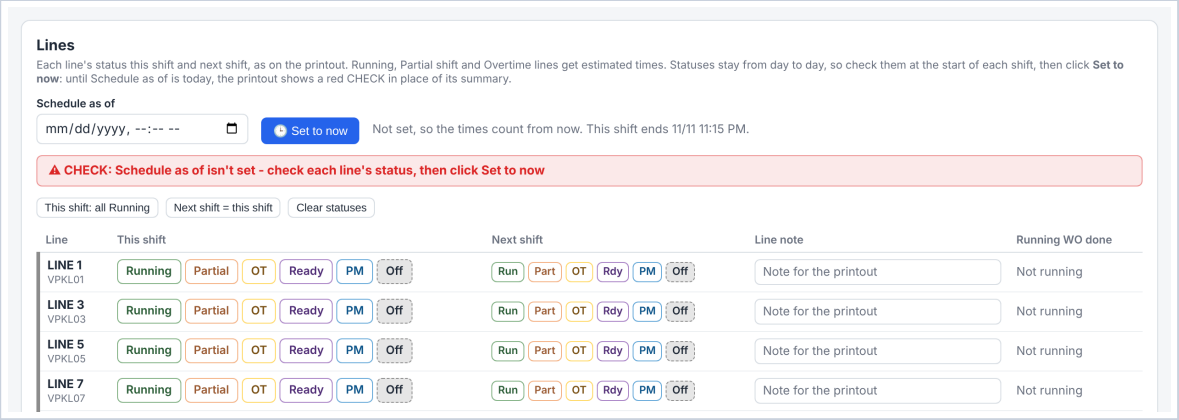

✓ **You should see:** the lines and work orders from your file (like the picture below).

B Set each line's status

Pick each line's status for this shift and next, then set the time to now.

1 Find the “Lines” panel

It is near the top of the Production Schedule tab, above the line bars (it took the place of the old Scheduled Lines box). It lists every line from the file.

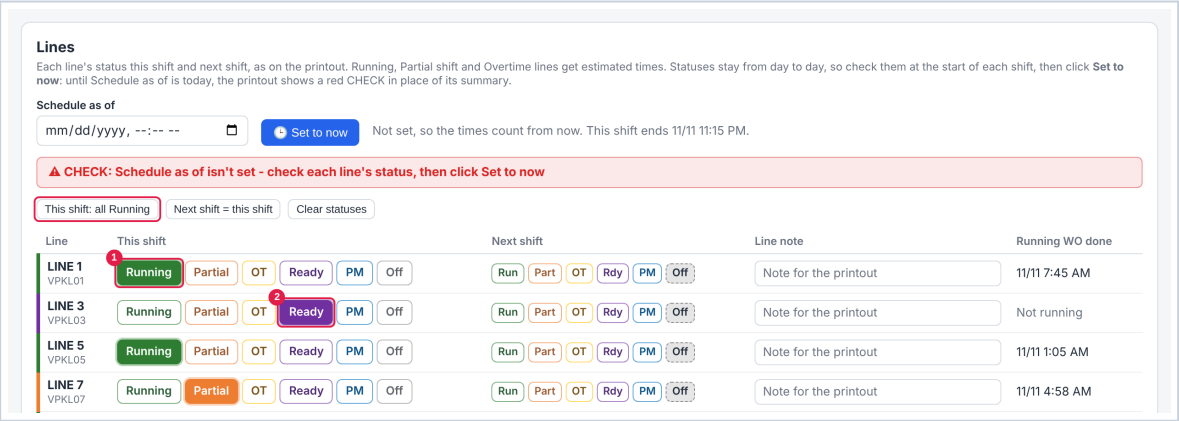

✓ **You should see:** each line's name, a row of colored buttons for **This shift** and a smaller row for **Next shift**, and a **Line note** box.

---

2 Click each line's status for this shift

In each line's **This shift** row, click one button: **Running**, **Partial** (runs part of the shift), **OT** (overtime), **Ready** (set up and ready to run), **PM** (maintenance or cleaning) or **Off** (not running). If most lines run, click **This shift: all Running** first, then change the others. Clicked the wrong one? Click the right one.

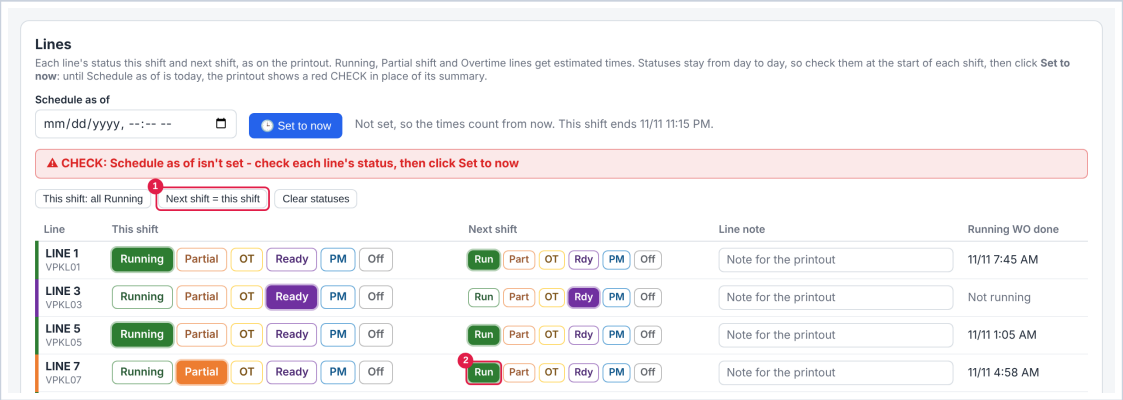

✓ **You should see:** the button you clicked fills in with its color. A button with a **dashed outline** is only the app's guess: click a status to set it.

---

3 Set next shift's status

Do the same in the smaller **Next shift** row. If next shift runs the same lines, click **Next shift = this shift** (1), then change any line that's different (2).

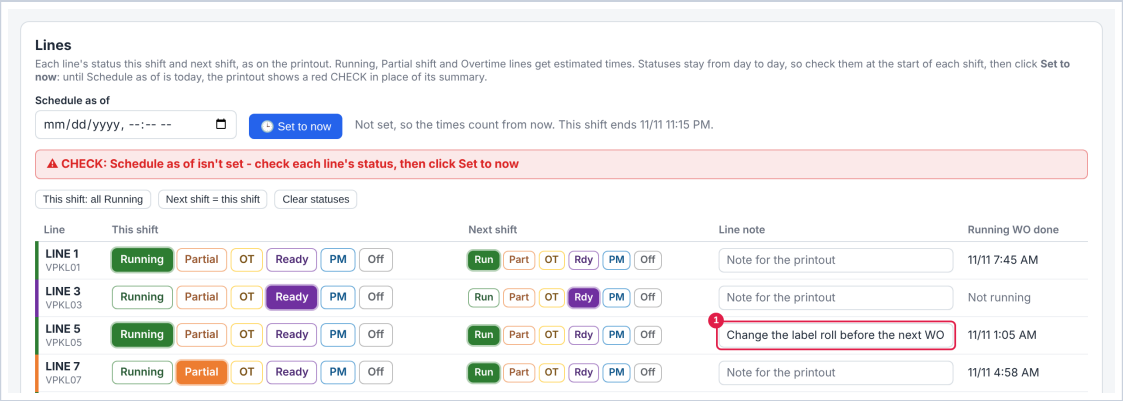

✓ **You should see:** each line's next shift status filled in. It prints on the right of the line's box.

---

4 Add a line note (optional)

To tell the next shift or the floor something about a line, type it in that line's **Line note** box and press Enter. It prints at the bottom of the line's box. The note stays until you empty the box.

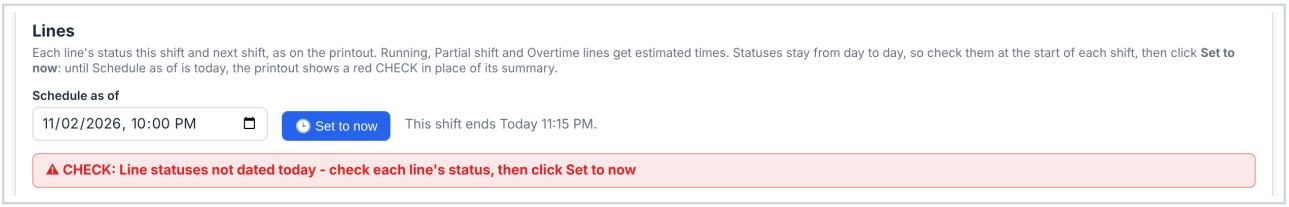

✓ **You should see:** the note in the preview, on a light blue band at the bottom of that line's box.

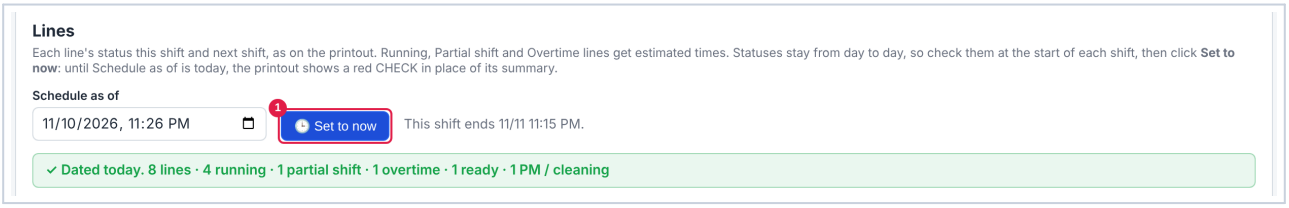

---

5 Click “Set to now”

It is next to **Schedule as of**, at the top of the Lines panel. The estimated times count from this time. Until it is today, the panel and the printout show a red **CHECK**, like this:

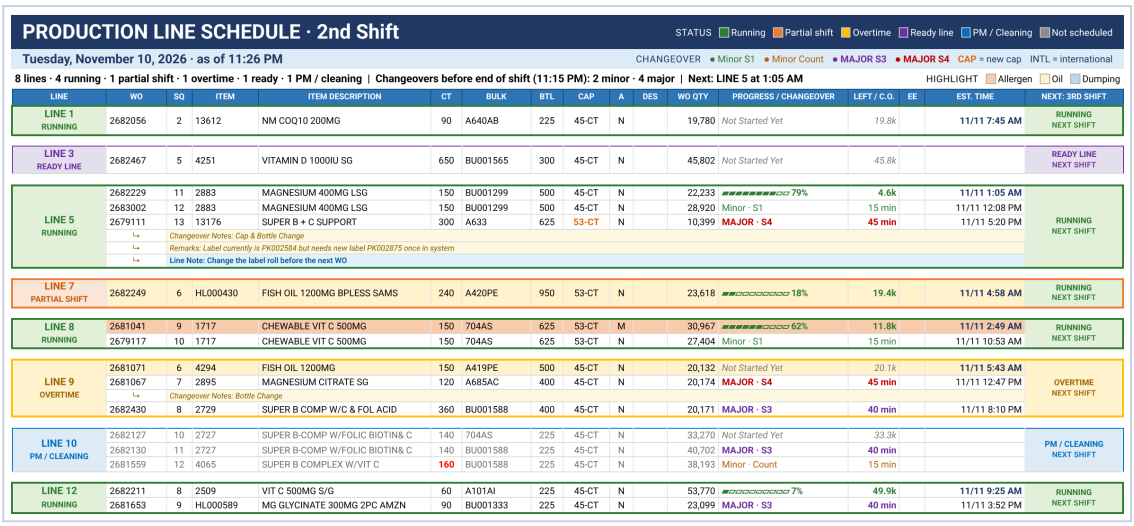

✓ **You should see:** after the click, the time is now and a green ✓ **Dated today** line with how many lines run.

6 Check the preview

Look at **Print Report Preview**, right under the Lines panel. This is exactly what will print. If it is hidden, click **▼ Show** on its bar.

✓ **You should see:** each line in a box of its status color, an estimated time on each work order of a running line, and **no red CHECK** at the top.

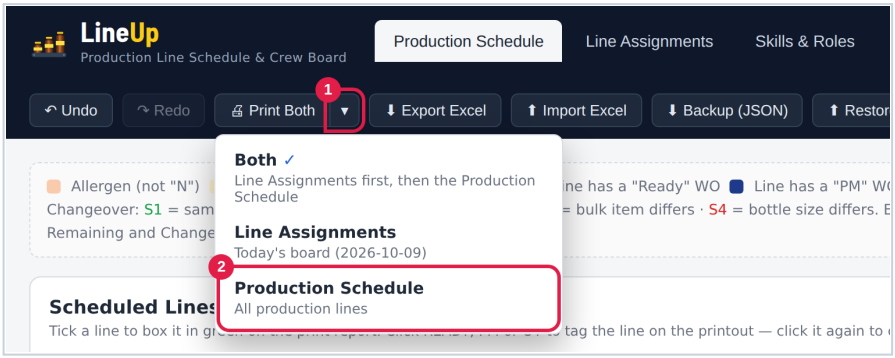

TIP: Statuses stay from day to day, and on every computer on your shift. At the start of each shift, check them and click **Set to now** again, and click it again before you print later in the shift, so the times are right.

C Print the schedule

Make sure Parts A and B are done first.

1 Scroll to the top, click ▾ next to Print, then pick what to print

The Print button has a printer picture and is in the dark toolbar. Click the small ▾ arrow next to it, then click **Production Schedule**. Pick **Both** instead to print today's Line Assignments board too — it comes out first, then the schedule. Next time, just click the Print button itself: it remembers what you picked.

✓ **You should see:** the print window opens, showing only what you picked.

2 Pick the printer and click “Print”

Next to **Destination**, pick your printer. Do not change the paper size or layout — the app already set them. Then click **Print**.

The print window (yours may look a little different):

Destination: **your printer**

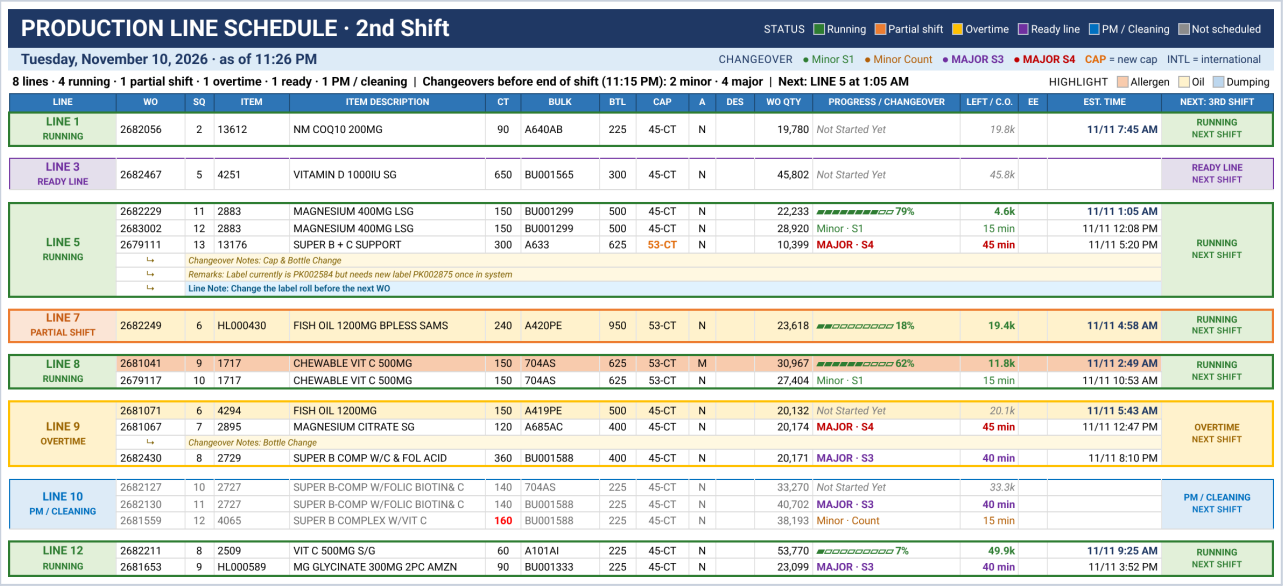

Pages: All Layout: (leave it)

More settings › **Background graphics** ☑ (only needed if the colors are missing)

Cancel | Print

3 Check the printout and post it

If you printed Both, the first sheet is the Line Assignments board and the second is the schedule. Make sure the schedule has today's date and time at the top, every line, and each line in the color of its status.

PRODUCTION LINE SCHEDULE · 2nd Shift

STATUS Running · Partial shift · Overtime · Ready line · PM / Cleaning · Not scheduled

Tuesday, November 10, 2026 · as of 11:26 PM

✓ **You should see:** a printout like this one, with **no red CHECK**. If it has one, click **Set to now** (Part B, step 5) and print again.

TIP: The colors, as in the legend at the top of the printout: green Running, orange Partial shift, yellow Overtime, purple Ready line, blue PM / Cleaning, gray Not scheduled.

? Something went wrong?

Find your problem on the left. Do what it says on the right.

Problem	What to do
It asks for the password again.	Normal after the app was closed, after 60 minutes without use, or 12 hours after Remember this computer. Unlock it (Part A, step 1).
A box says “Still there?”	Click **Stay unlocked**. If nobody does, the app locks in 1 minute.
It says the password isn't right.	Check Caps Lock. Click **Show** to check what you typed.
It says “Access restricted”.	This computer's network isn't approved for LineUp. Use a company computer, or contact the LineUp administrator.
I can't find the “Import Excel” button.	Click the **Production Schedule** tab first (Part A, step 3).
The schedule shown is for the wrong shift.	Click **Lock** (top right), then unlock with your shift's password.
A red bar says changes aren't reaching the cloud.	Click **Lock** and unlock again. If the bar stays, check this computer's internet connection.
The number of work orders looks wrong.	Click **Cancel**. Check you picked today's file and try again.
I clicked the blue button on the wrong file.	Click **Undo** (top left) right away. If you already refreshed the page, import the right file again (Part A).
Import says “Can't tell which column is the Line” (or WO #).	Set the **Goes into** box of the column with the line names or work order numbers (Part A, step 6).
A pop-up says “Could not read that spreadsheet”.	The file is not an Excel file or is damaged. Open it in Excel, save it as **.xlsx**, and import again.
No Lines panel.	The schedule is empty. Do Part A first.
A red CHECK on the printout.	Click **Set to now** in the Lines panel (Part B, step 5). If it stays, read the red line under Schedule as of: it says what to fix (for example a WO on two rows).
A line has the wrong color.	Click its right status in the Lines panel (Part B, step 2).
“No line rate” instead of a time.	That line and item have no rate in the Packaging Lead Hub (Stored Data → Line Rates). Ask a Hub admin to add it.
The times look wrong.	Click **Set to now**, and check the line's status (Part B). Lines 1 to 7 stop for breaks and lunch; Lines 8 and up run through them.
Holiday pictures on the printout.	A holiday theme is on. To turn it off: **Customize Print Design → Holiday theme → Off**.
The printout has no colors.	In the print window open **More settings** and tick **Background graphics**.
The schedule prints on 2 pages or is cut off.	Set **Print size** to **Fit to one page** (Extras, step 1), then print again.
Print does nothing.	Refresh the page (press F5) and click Print again.
The wrong report printed (or only one of the two).	Click the ▾ next to Print and pick what to print.
I clicked “Reset to sample data” or “Wipe all data”.	Click **Cancel** in the box that asks for WIPE. If it already ran, click **Undo** right away.

+ Extras (optional)

You do not need these for a normal print.

1 Make the schedule fit on one page

Click **Customize Print Design** (right under the Print Report Preview) to open it. Next to **Print size**, pick **Fit to one page**. Print again.

✓ **You should see:** the Print size box says Fit to one page.

2 Hide a column from the printout

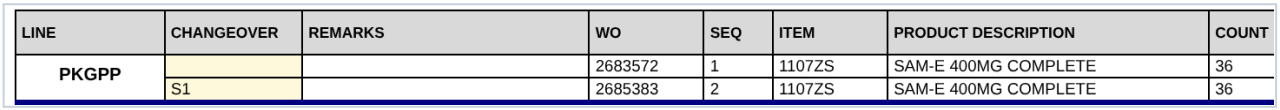

Above the Print Report Preview, tick the name of the column you do not want printed. Untick it to bring it back.

✓ **You should see:** the column disappears from the preview.

3 Move a column on the printout

In the Print Report Preview, press and hold a column's name, drag it left or right, and let go where you want it. LINE always stays first. To put every column back, click **Reset column order**.

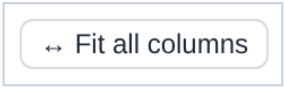

LINE	CHANGEOVER	REMARKS	WO	SEQ	ITEM	PRODUCT DESCRIPTION	COUNT
PKGPP			2683572	1	1107ZS	SAM-E 400MG COMPLETE	36
	S1		2685383	2	1107ZS	SAM-E 400MG COMPLETE	36

✓ **You should see:** the column in its new place in the preview — it prints the same way.

4 Fit the columns to the page

Above the Print Report Preview, click **↔ Fit all columns**. Every column becomes as wide as what's in it, and Product Description, Cap Description and Remarks share the rest. To fit just one column, double-click its edge in the preview.

✓ **You should see:** no number in the preview ends in “…”.

5 Change a column's printed title

Open **Customize Print Design**. Under **Column titles on the printout**, type the title you want in that column's box. Leave a box empty to print the column's full name. Short titles keep narrow columns narrow. **Reset to defaults** brings back the short titles.

✓ **You should see:** the new title on that column in the preview.

---

6 Choose a design for the printout

In Customize Print Design, under **Design**, click **Line boxes** (the starting design: each line in a box of its status color), **Classic**, **Clean grid**, **Line bands** or **Striped table**. Your shift keeps the design you pick. In the other designs, click **Fit all columns** (step 4) after.

✓ **You should see:** the Print Report Preview changes to the new look.

---

7 Turn on a holiday theme

In Customize Print Design, next to **Holiday theme**, pick **Automatic** to decorate the printout for each holiday on its own dates, or pick one holiday. Pick **Off** to turn it off. Untick **Scene under the schedule** to leave out the pictures under the last line. They only print when there's room on the page. On Line boxes, the line colors never change.

✓ **You should see:** the holiday's colors, pictures and greeting in the preview (on Automatic, only on the holiday's dates).

---

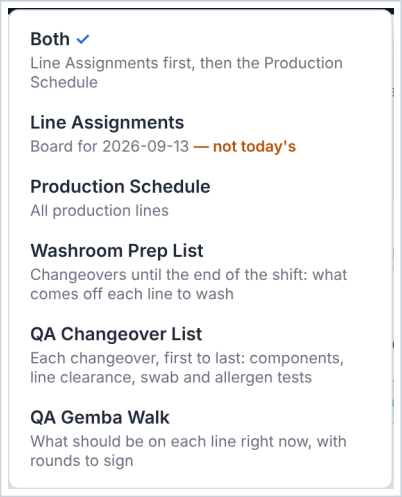

8 Changeover notes and “Cap Change”

Under each work order, the printout lists what changes from the one before it on the line: cap, bottle, cotton, desiccant, dumping and international, and on Lines 3, 7, 8 and 11 (the Merrill fillers) a count change with **Filler Slate Setup**. A line note prints under the line's last work order. In the table, an empty Remarks box shows **Cap Change** in gray when the cap changes, and it prints. Type a remark to print yours instead.

---

9 Print the Washroom Prep List

Click ▾ next to Print, then **Washroom Prep List**. It lists every changeover until the end of the shift, first to last: the time, line, filler, type and minutes, what comes off the line to wash and what goes on, with a Done box.

✓ **You should see:** one sheet of changeovers. Click **Set to now** first, so the times are right.

---

10 Print the QA sheets

For QA, click ▾ next to Print, then **QA Changeover List** (each changeover with a box for every component that changes, line clearance, swab and allergen tests, and QA initials) or **QA Gemba Walk** (what should be on each running line now, with three rounds to sign).

✓ **You should see:** the sheet comes out with today's date and the shift.

---

11 Change how the times are estimated

In the **Estimated times** panel (under the Print Report Preview): the line efficiency, the share of a full hour that a break and a lunch hour make, and the minutes for each changeover type. Your shift keeps them. Leave them alone unless your lead asks.

✓ **You should see:** the times in the preview change.

QUICK CARD — Production Schedule

Cut out or post this page at the computer

A. Load the schedule

1	Open the app: pick your shift, type its password → **Unlock**
2	Top right: check it says **your shift**
3	Click the **Production Schedule** tab
4	Click **Import Excel**
5	Pick today's file → **Open**
6	Check the rows → blue **Replace** button

B. Set each line's status

1	In **Lines**, click each line's status this shift
2	Set next shift (or **Next shift = this shift**)
3	Type a **Line note** if needed (optional)
4	Click **Set to now**, then check the preview: no red CHECK

C. Print

1	Click ▾ next to **Print** → **Production Schedule** (or **Both**)
2	Pick the printer → **Print**
3	Check the printout and post it

STOP: **Never** click “Reset to sample data” or “Wipe all data”. Made a mistake? Click **Undo** right away.
