JOB INSTRUCTION

Production Schedule: Load it, Pick the Lines, Print it

Follow the steps in order. Do one step at a time. Each step shows exactly what to click.

For	Anyone printing the Production Schedule (1st, 2nd or 3rd shift)	**Prepared by**	
Time	About 5 minutes	**Approved by**	

You will do 3 jobs, in this order

A
Load the schedule
Bring in the Excel file

B
Pick the lines
Tick the lines running today

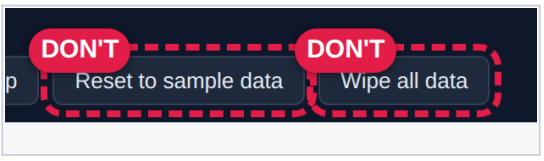

C
Print it
Print and post the report

What you need

• A computer with LineUp open in the web browser.
• Your shift's **password**. The app asks for it every time it is opened.
• Today's Excel schedule file saved on that computer (it ends in **.xlsx**, **.xlsm** or **.xls**). It is usually in the **Downloads** folder.
• A printer.

3 golden rules

1. **Check the shift first.** The top right corner must show YOUR shift. If it shows another shift, click Lock and unlock with your shift's password.
2. **Check the import screen before you click the blue button.** It replaces the whole schedule for your shift.
3. **Never click these two buttons.** They erase the schedule for the whole shift. If you click one by mistake, click **Cancel**. Never type WIPE.

Never click “Reset to sample data” or “Wipe all data”.

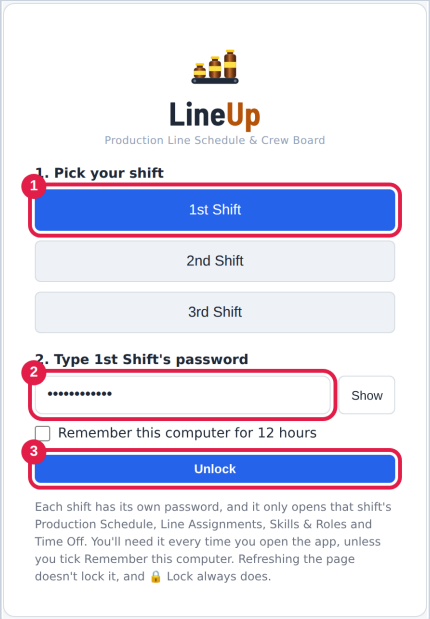

TIP: Made a mistake? Click **Undo** (top left of the app) **right away** — before you refresh or close the page. It puts things back the way they were.

A Load the schedule from Excel

Do this once at the start of the shift, or when a new schedule comes out.

1 Unlock the app

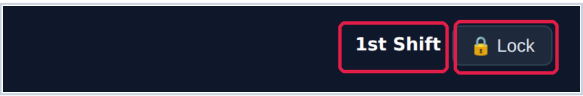

A short intro plays first (click anywhere to skip it). The app asks for this every time it is opened. Click your shift (1), type your shift's password (2), then click **Unlock** (3). Click **Show** to see what you typed. To skip the password on this computer for 12 hours, tick **Remember this computer** before you click Unlock.

✓ **You should see:** the app opens. It stays unlocked until the app is closed (or for 12 hours if you ticked Remember this computer), or until someone clicks Lock. Refreshing the page does not lock it.

2 Check the shift in the top right corner

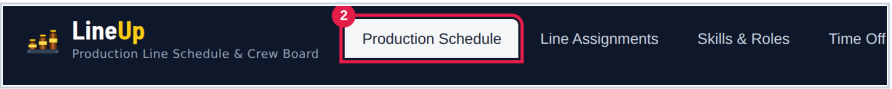

It must say **your** shift (1st Shift, 2nd Shift or 3rd Shift). If it shows another shift, click **Lock**, then unlock with your shift's password (step 1).

✓ **You should see:** your shift's name next to the Lock button.

3 Click the “Production Schedule” tab

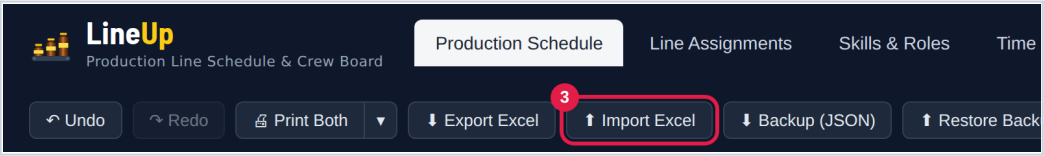

It is at the top of the page, next to the app name.

✓ **You should see:** the Production Schedule tab turns white (selected).

4 Click “Import Excel”

It is in the dark toolbar under the tabs.

✓ **You should see:** a window opens to pick a file.

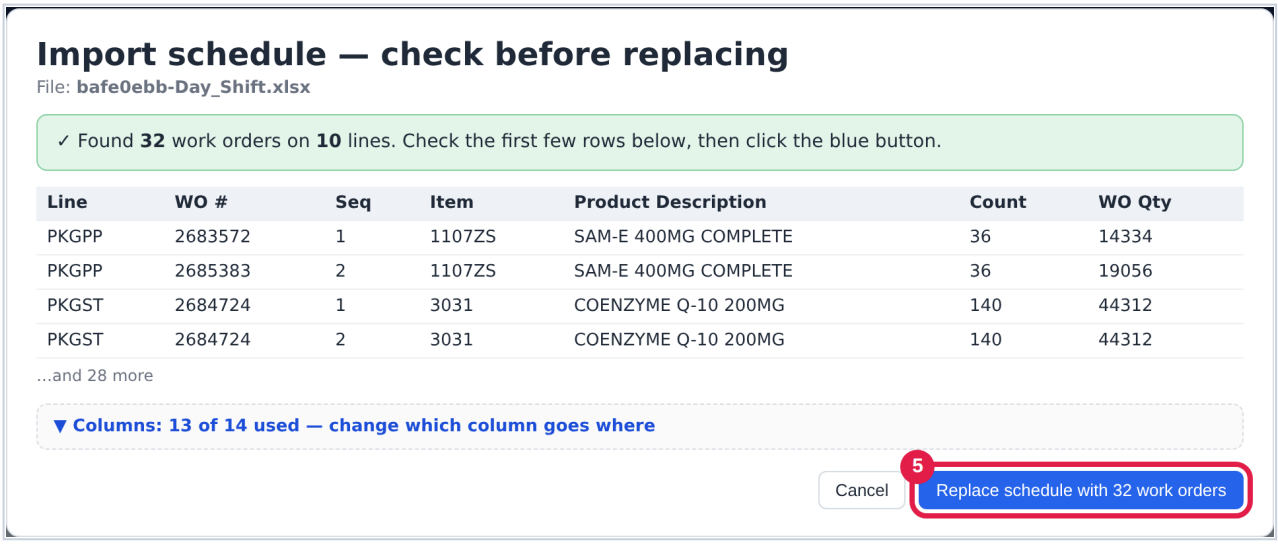

5 Pick the Excel file and click “Open”

In the window: click **Downloads** on the left (or wherever the file was saved). Click the schedule file **once**, then click **Open**.

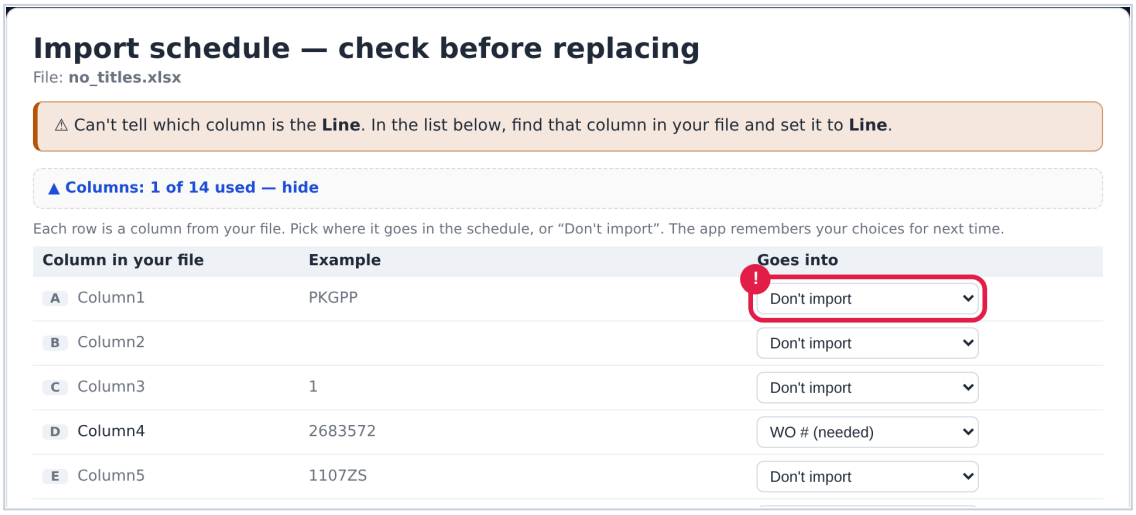

✓ **You should see:** the **Import schedule — check before replacing** screen (next step).

6 Check the import screen, then click the blue button

The green box says how many work orders it found, with the first few rows underneath. If they look right, click the blue **Replace schedule with … work orders** button. If the number looks wrong (for example far too few), click **Cancel** and check you picked the right file.

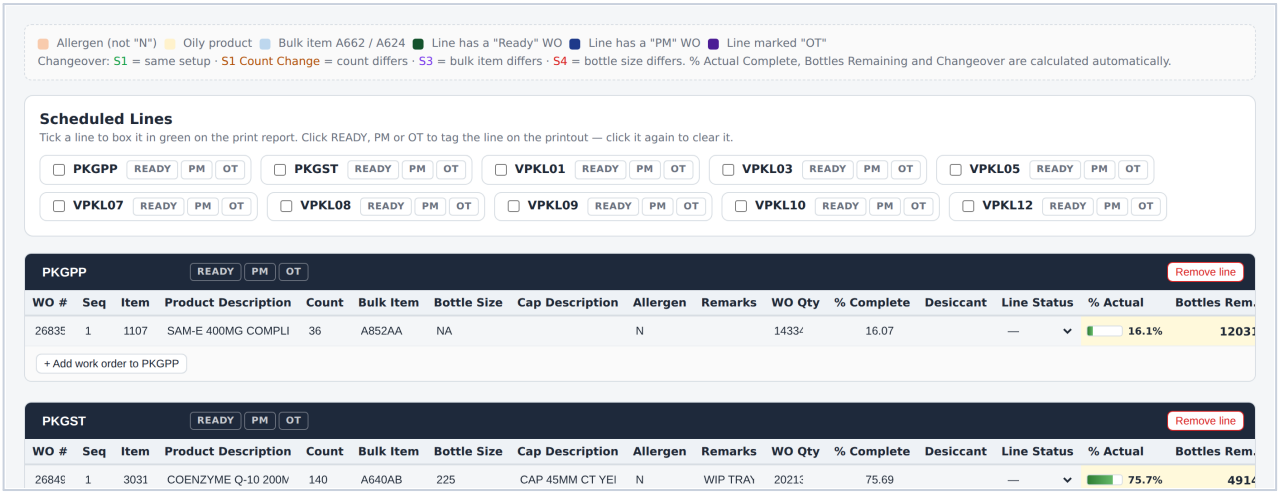

CAREFUL: If the box is orange and says “Can't tell which column is the Line” (or WO #): the list of your file's columns opens by itself. Find the column that holds the line names (like VPKL01) or the work order numbers — the **Example** column shows what's in it — and in its **Goes into** box pick **Line** or **WO #**. The blue button turns on. The app remembers this, so next time it's automatic.

Here the Line column was not found — set Column1 (it holds PKGPP) to **Line**.

7 Check the schedule loaded

Scroll down a little. Each production line has its own dark bar with its work orders underneath. Pick 2 or 3 work order numbers and make sure they match the Excel file.

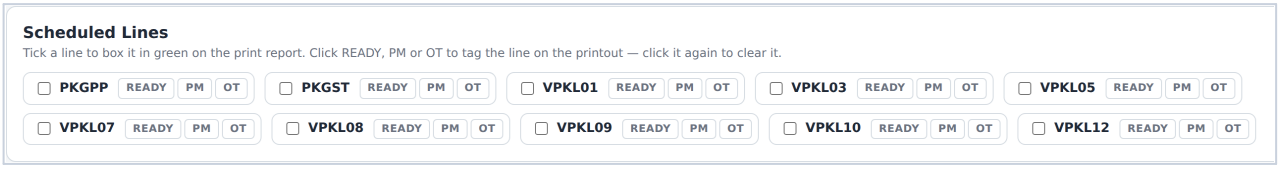

✓ **You should see:** the lines and work orders from your file (like the picture below).

B Pick the lines running this shift

Tick the running lines, and mark any line that is READY or down for PM.

1 Find the “Scheduled Lines” box

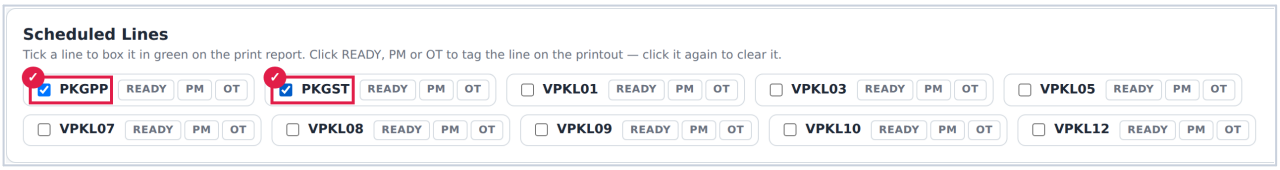

It is near the top of the Production Schedule tab, above the line bars. It lists every line from the file.

✓ **You should see:** each line's name with a tick box and **READY / PM / OT** buttons next to it.

2 Tick every line that is running this shift

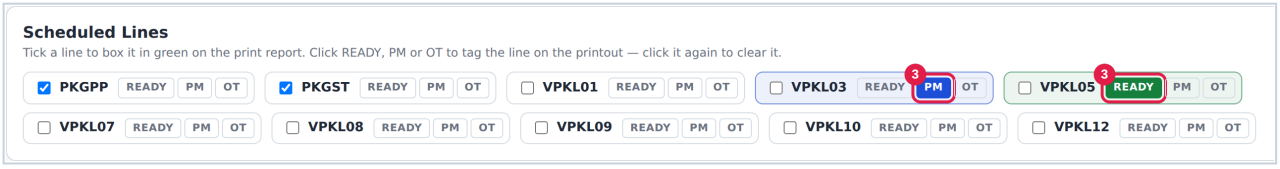

Click the box next to each running line so a tick appears. Leave the other lines empty. Clicked the wrong one? Click it again to remove the tick.

✓ **You should see:** a tick in the box of each running line.

3 Mark READY or PM lines

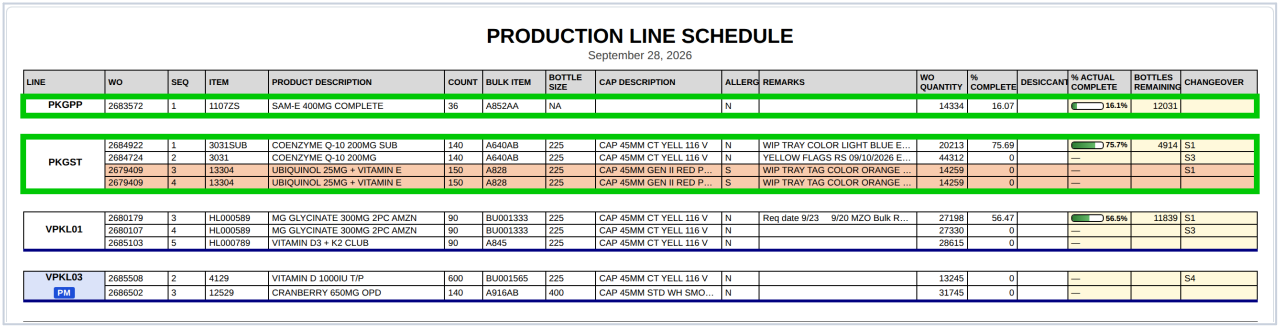

Next to a line that is set up and ready to run, click **READY**. Next to a line that is down for maintenance, click **PM**. Clicked the wrong one? Click it again to clear it. Leave the rest alone.

✓ **You should see:** the button fills in (green for READY, blue for PM) and the line's box turns the same color.

4 Check the green borders and tags

Look at **Print Report Preview**, right under the Scheduled Lines box. This is exactly what will print. If it is hidden, click **▼ Show** on its bar.

✓ **You should see:** a **green border** around each line you ticked (in the Line bands design, its name in a green band with a ✓), and a **READY** or **PM** tag under the name of each line you marked. Lines you did not tick still print, without the green.

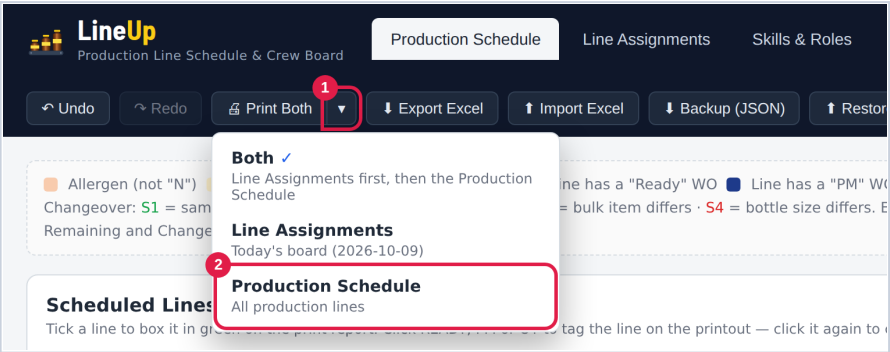

TIP: Ticks are saved by themselves and show up on every computer on your shift. You do not need to tick the lines again after a new import unless the running lines changed. READY / PM marks go with the work orders, so mark them again after importing a new schedule.

C Print the schedule

Make sure Parts A and B are done first.

1 Scroll to the top, click ▾ next to Print, then pick what to print

The Print button has a printer picture and is in the dark toolbar. Click the small ▾ arrow next to it, then click **Production Schedule**. Pick **Both** instead to print today's Line Assignments board too — it comes out first, then the schedule. Next time, just click the Print button itself: it remembers what you picked.

✓ **You should see:** the print window opens, showing only what you picked.

2 Pick the printer and click “Print”

Next to **Destination**, pick your printer. Do not change the paper size or layout — the app already set them. Then click **Print**.

The print window (yours may look a little different):

Destination: **your printer**

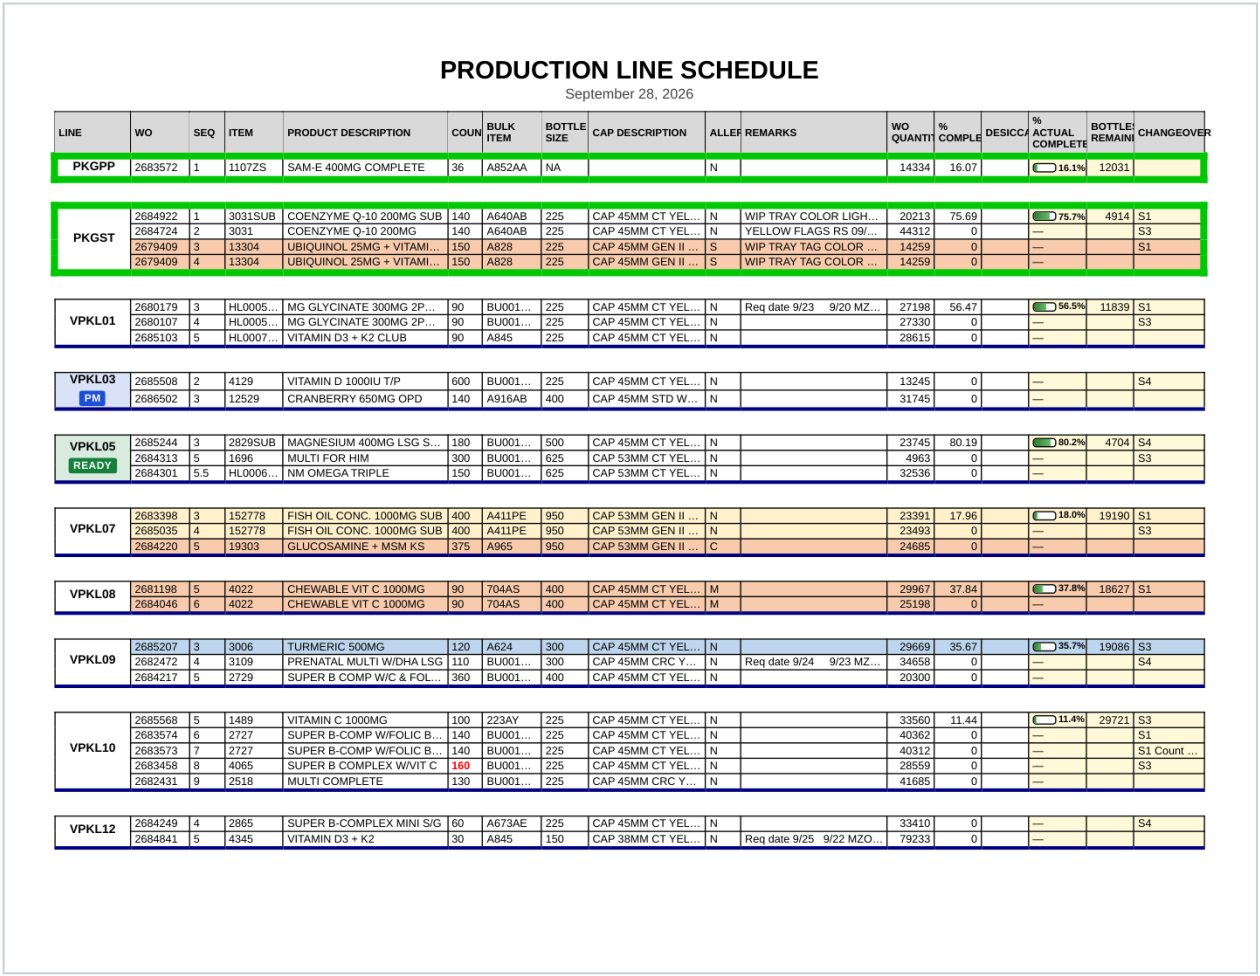

Pages: All Layout: (leave it)

More settings › **Background graphics** ☑ (only needed if the colors are missing)

Cancel | Print

3 Check the printout and post it

If you printed Both, the first sheet is the Line Assignments board and the second is the schedule. Make sure the schedule has today's date, every line, the running lines marked in green, and a **READY** or **PM** tag under the name of any line with that status.

✓ **You should see:** a printout like this one.

Something went wrong?

Find your problem on the left. Do what it says on the right.

Problem	What to do
It asks for the password again.	Normal after the app was closed, after 60 minutes without use, or 12 hours after Remember this computer. Unlock it (Part A, step 1).
A box says “Still there?”	Click **Stay unlocked**. If nobody does, the app locks in 1 minute.
It says the password isn't right.	Check Caps Lock. Click **Show** to check what you typed.
I can't find the “Import Excel” button.	Click the **Production Schedule** tab first (Part A, step 3).
The schedule shown is for the wrong shift.	Click **Lock** (top right), then unlock with your shift's password.
A red bar says changes aren't reaching the cloud.	Click **Lock** and unlock again. If the bar stays, check this computer's internet connection.
The number of work orders looks wrong.	Click **Cancel**. Check you picked today's file and try again.
I clicked the blue button on the wrong file.	Click **Undo** (top left) right away. If you already refreshed the page, import the right file again (Part A).
Import says “Can't tell which column is the Line” (or WO #).	Set the **Goes into** box of the column with the line names or work order numbers (Part A, step 6).
Something went into the wrong column.	Import again, open **Columns …** and fix that column's **Goes into** box. The app remembers it.
A pop-up says “Could not read that spreadsheet”.	The file is not an Excel file or is damaged. Open it in Excel, save it as **.xlsx**, and import again.
No Scheduled Lines box.	The schedule is empty. Do Part A first.
No green on the running lines.	Tick the running lines in **Scheduled Lines** (Part B), then print again.
A number ends in “…”.	Above the Print Report Preview, click **Fit all columns**, then print again.
Holiday pictures on the printout.	A holiday theme is on. To turn it off: **Customize Print Design** → **Holiday theme** → **Off**.
The printout has no colors.	In the print window open **More settings** and tick **Background graphics**.
The schedule prints on 2 pages or is cut off.	See the next page: set **Print size** to **Fit to one page**, then print again.
Print does nothing.	Refresh the page (press F5) and click Print again.
The wrong report printed (or only one of the two).	Click the ▾ next to Print and pick **Production Schedule**, **Line Assignments** or **Both**.
I clicked “Reset to sample data” or “Wipe all data”.	Click **Cancel** in the box that asks for WIPE. If it already ran, click **Undo** right away.

+ Extras (optional)

You do not need these for a normal print.

1 Make the schedule fit on one page

Click **Customize Print Design** (right under the Print Report Preview) to open it. Next to **Print size**, pick **Fit to one page**. Print again.

✓ **You should see:** the Print size box says Fit to one page.

2 Hide a column from the printout

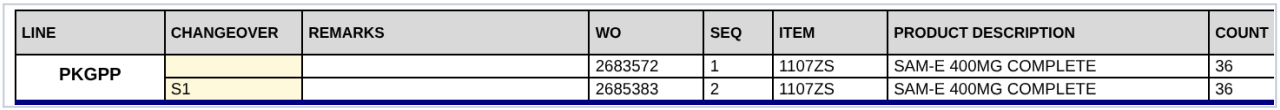

Above the Print Report Preview, tick the name of the column you do not want printed. Untick it to bring it back.

✓ **You should see:** the column disappears from the preview.

3 Move a column on the printout

In the Print Report Preview, press and hold a column's name, drag it left or right, and let go where you want it. LINE always stays first. To put every column back, click **Reset column order**.

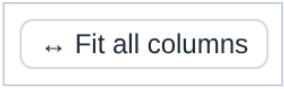

LINE	CHANGEOVER	REMARKS	WO	SEQ	ITEM	PRODUCT DESCRIPTION	COUNT
PKGPP			2683572	1	1107ZS	SAM-E 400MG COMPLETE	36
	S1		2685383	2	1107ZS	SAM-E 400MG COMPLETE	36

✓ **You should see:** the column in its new place in the preview — it prints the same way.

4 Fit the columns to the page

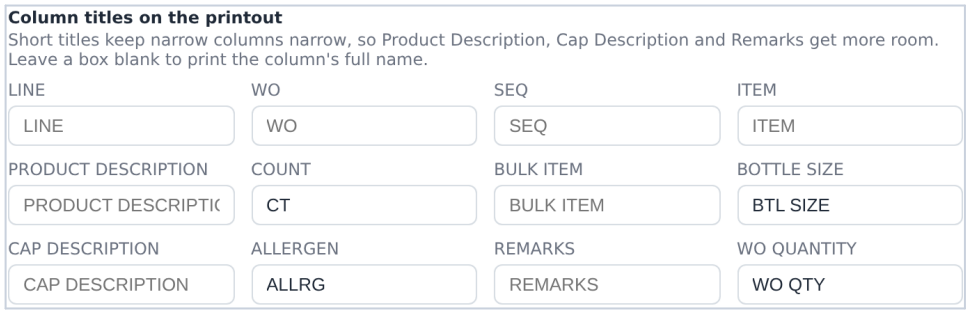

Above the Print Report Preview, click **↔ Fit all columns**. Every column becomes as wide as what's in it, and Product Description, Cap Description and Remarks share the rest. To fit just one column, double-click its edge in the preview.

✓ **You should see:** no number in the preview ends in “…”.

5 Change a column's printed title

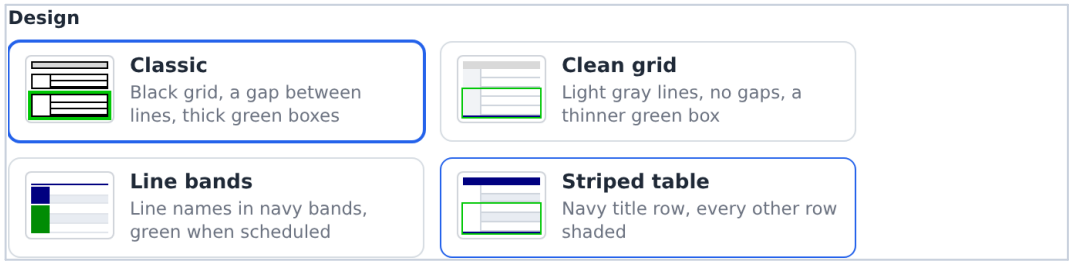

Open **Customize Print Design**. Under **Column titles on the printout**, type the title you want in that column's box. Leave a box empty to print the column's full name. Short titles keep narrow columns narrow. **Reset to defaults** brings back the short titles.

✓ **You should see:** the new title on that column in the preview.

6 Choose a design for the printout

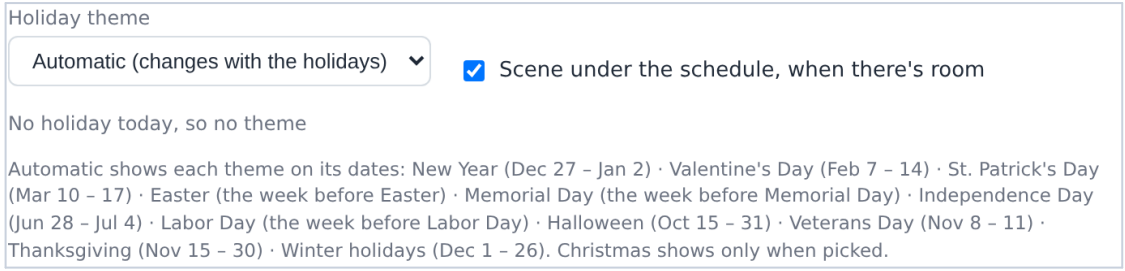

In **Customize Print Design**, under **Design**, click **Classic**, **Clean grid**, **Line bands** or **Striped table**. Then click **Fit all columns** (step 4). Your shift keeps the design you pick.

✓ **You should see:** the Print Report Preview changes to the new look.

7 Turn on a holiday theme

In **Customize Print Design**, next to **Holiday theme**, pick **Automatic** to decorate the printout for each holiday on its own dates, or pick one holiday. Pick **Off** to turn it off. Untick **Scene under the schedule** to leave out the pictures under the last line. They only print when there's room on the page.

✓ **You should see:** the holiday's pictures and greeting in the preview (on Automatic, only on the holiday's dates).

QUICK CARD — Production Schedule

Cut out or post this page at the computer

A. Load the schedule

1	Open the app: pick your shift, type its password → **Unlock**
2	Top right: check it says **your shift**
3	Click the **Production Schedule** tab
4	Click **Import Excel**
5	Pick today's file → **Open**
6	Check the rows → blue **Replace** button

B. Pick the lines

1	In **Scheduled Lines**, tick every running line
2	Click **READY** or **PM** next to lines that need it
3	Check the **green borders** and tags in the preview

C. Print

1	Click ▾ next to **Print** → **Production Schedule** (or **Both**)
2	Pick the printer → **Print**
3	Check the printout and post it

STOP: **Never** click “Reset to sample data” or “Wipe all data”. Made a mistake? Click **Undo** right away.
